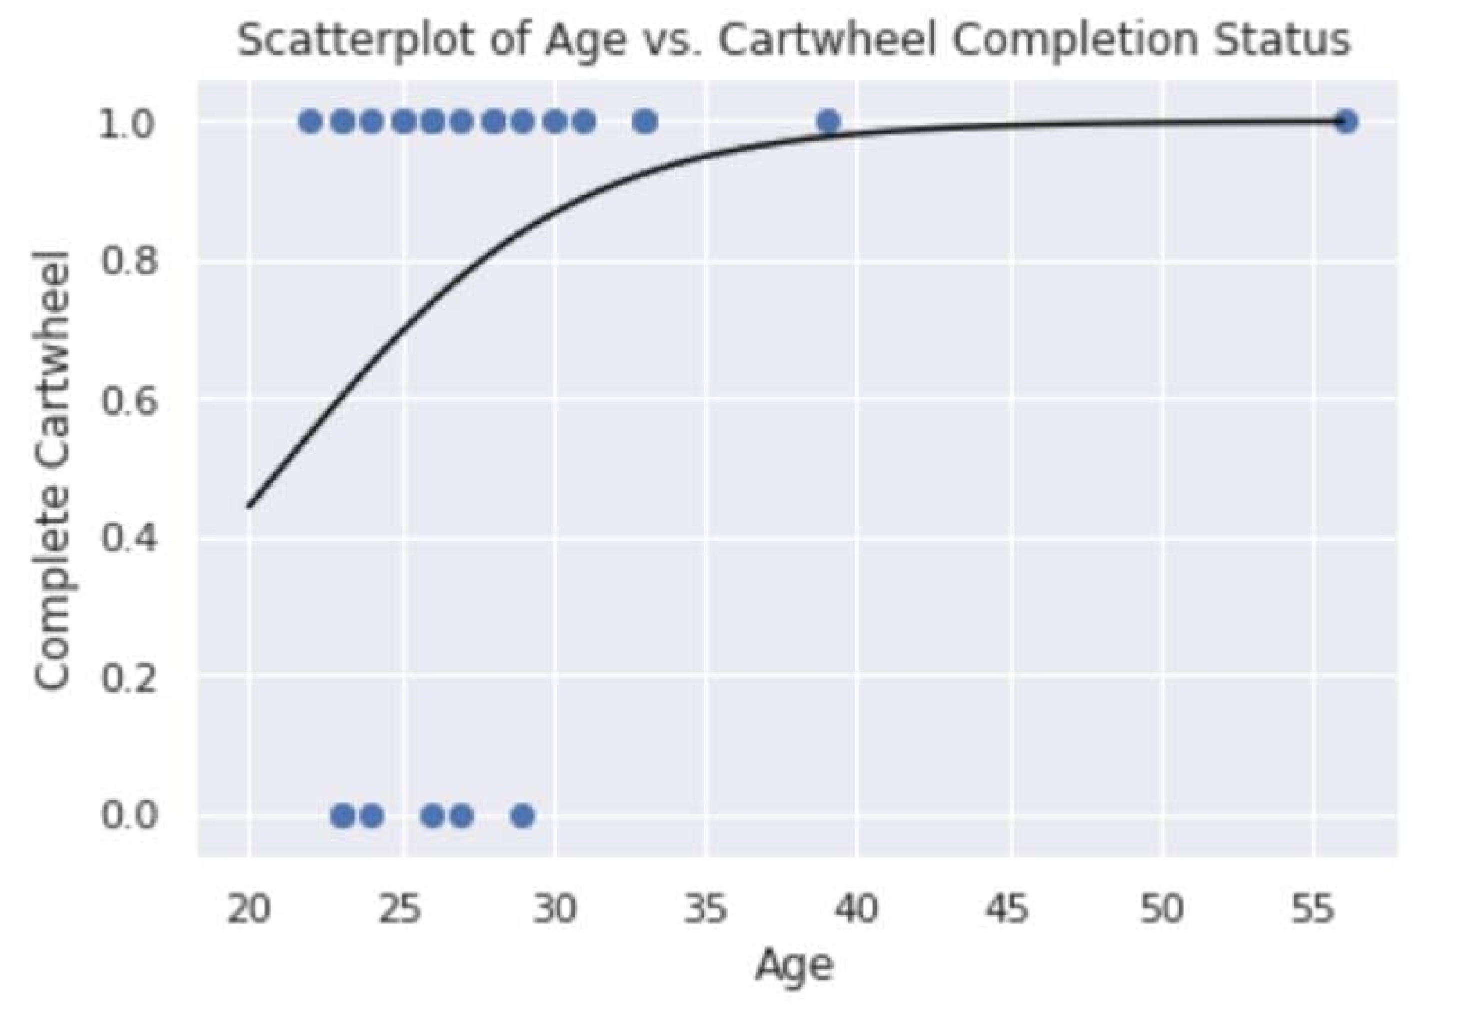
Cartwheel Data

Random sample of 25 adults attempted cartwheels

Primary Variable of interest: Cartwheel completion

Based on age, can we predict whether a cartwheel is completed?

Logistic Regression Line



Generalized Linear Model Regression Results

IVQ

Does it seem reasonable that there is a significant slope?

We'll continue working through the hypothesis testing framework before coming back to the answer of the IVQ.

Hypothesis Testing

Hypothesis Testing

H_0: $\beta_1 = 0$

H_a: $\beta_1 \neq 0$

Hypothesis Testing

$H_0: \beta_1 = 0$

$H_a: \beta_1 \neq 0$

Test statistic: $\dfrac{b_1 - 0}{s.e.(b_1)}$

Hypothesis Testing

H_0: $\beta_1 = 0$
H_a: $\beta_1 \neq 0$

Test statistic: $\dfrac{b_1 - 0}{\text{s.e. }(b_1)}$

	coef	std err	z	P>|z|	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Hypothesis Testing

H_0: $\beta_1 = 0$
H_a: $\beta_1 \neq 0$

Test statistic: $$\frac{b_1 - 0}{\text{s.e.}\ (b_1)} = \frac{0.2096}{0.171}$$

	coef	std err	z	P>|z|	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Hypothesis Testing

$H_0: \beta_1 = 0$

$H_a: \beta_1 \neq 0$

Test statistic: $\dfrac{b_1 - 0}{\text{s.e. } (b_1)} = \dfrac{0.2096}{0.171} = 1.225$

	coef	std err	z	P>|z|	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Hypothesis Testing

$H_0: \beta_1 = 0$

$H_a: \beta_1 \neq 0$

Test statistic: $\dfrac{b_1 - 0}{\text{s.e. } (b_1)} = \dfrac{0.2096}{0.171} = 1.225$

	coef	std err	z	P>|z|	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Hypothesis Testing

$H_0: \beta_1 = 0$

$H_a: \beta_1 \neq 0$

Test statistic: $$\frac{b_1 - 0}{\text{s.e. }(b_1)} = \frac{0.2096}{0.171} = 1.225$$

	coef	std err	z	P>lzl	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Hypothesis Testing

$H_0: \beta_1 = 0$
$H_a: \beta_1 \neq 0$

With our p-value of about 0.221, we would fail to reject the null hypothesis and cannot conclude that we have a significantly linear relationship between age and the log odds of the probability of successfully completing a cartwheel.

Test statistic: $\dfrac{b_1 - 0}{\text{s.e. }(b_1)} = \dfrac{0.2096}{0.171} = 1.225$

	coef	std err	z	P>|z|	[0.025	0.975]
Intercept	-4.4213	4.429	-0.998	0.318	-13.101	4.259
Age	0.2096	0.171	1.225	0.221	-0.126	0.545

Summary

Logistic regression for a predicted variable with two options

~correct/incorrect or success/failure

Summary

Logistic regression for a predicted variable with two options

~correct/incorrect or success/failure

Confidence Intervals and Hypothesis Tests follow similar format as linear regression

~changing interpretation to the logistic context

Summary
